

1

ABSTRACT

2 A night light design which allows for improved functionality over those heretofore
3 available. The basic design is flexible enough to be adapted for either indoor or outdoor use, and
4 for various brightness levels. Particularly for outdoor use, bulbs of up to 15 watts can be used,
5 providing an increased illumination level. All designs preferably include a light sensing element
6 and a control circuit, wherein the light turns itself on when the ambient lighting levels fall low
7 enough. Also, several preferred embodiments include a variable control, wherein the brightness
8 of the night light can be continuously varied between very dim and full brightness.
